**ABSTRACT Objective:** To research the effects of recombinant brain natriuretic peptide on inflammatory factors and renin system in patients with acute decompensated heart failure. **Methods:** 160 patients with acute decompensated heart failure who were treated in our hospital from July 2014 to July 2016 were selected and randomly divided into two groups, with 80 cases in each group. The patients in the control group were treated with sodium nitroprusside, while the patients in the experimental group were treated with recombinant brain natriuretic peptide. Then the serum levels of tumor necrosis factor alpha (TNF-α), hypersensitive c-reactive protein (hs-CRP), interleukin-6 (IL-6), brain natriuretic peptide (BNP), aldosterone, aldosterone II, plasma renin activity, hemodynamics and heart functions of patients between the two groups were observed and compared before and after the treatment. **Results:** After treatment, the serum levels of TNF-α, hs-CRP, IL-6 and BNP of the experimental group were lower than those of the control group, and the differences were statistically significant ( $P<0.05$ ); After treatment, the levels of the aldosterone, aldosterone II and plasma renin activity of the experimental group were lower than those of the control group, and the differences were statistically significant ( $P<0.05$ ); After treatment, the hemodynamics of the experimental group was lower than that of the control group, and the difference was statistically significant ( $P<0.05$ ). The improvement of heart function of the experimental group was more obvious than that of the control group ( $P<0.05$ ). The incidence of complications in the experimental group was lower than that of the control group ( $P<0.05$ ). **Conclusions:** Recombinant brain natriuretic peptide has better clinical efficacy on the treatment of the acute decompensated heart failure, which can reduce the serum levels of the inflammatory factors, and improve the renin-angiotensin-aldosterone system.

**Key words:** Acute decompensated heart failure; Recombinant brain natriuretic peptide; Inflammatory factor; Renin system

### 前言

急性心力衰竭是一种心力衰竭加重或者急性发作的临床综合征,且急性失代偿期是其严重阶段,可导致患者住院病死率增加<sup>[1]</sup>。有报道发现,炎症因子能够促进心室重构,从而造成心力衰竭加剧<sup>[2]</sup>。相关研究指出,急性失代偿性心力衰竭能够异

常激活内分泌系统,诱导肾素系统的异常表达,形成一种恶性循环,导致心力衰竭进一步加重<sup>[3,4]</sup>。目前临床多采用扩血管、强心、利尿等对症治疗,但其抗心衰效果并不理想<sup>[5]</sup>。重组脑钠肽是一种人工多肽,存在扩血管、利钠、抗纤维化等药物功效,现已逐步开展于心血管疾病治疗<sup>[6]</sup>。本研究就急性失代偿性心力衰竭患者使用重组脑钠肽治疗对炎症因子及肾素系统的影响

## 3 讨论

急性失代偿性心力衰竭因心脏泵功能异常能够激活系列细胞及神经体液因子,其中肾素系统的异常激活是发病机制的主要因素,能够导致血管平滑肌出现收缩,增加阻力,使心室负荷加重,造成心血管系统对去甲肾上腺素的敏感性增强,利于醛固酮的分泌,导致心力衰竭出现恶化<sup>[8,9]</sup>。内源性BNP是一种多肽,由心室及心房分泌,其中左心室是其主要分泌场所,能够起到扩张血管、减少水钠潴留、促进尿钠排泄、抑制交感神经活性、拮抗肾素等作用,也能够介导心室的压力负荷及收缩功能,其分泌增加是机体心功能不全时的一种代偿机制<sup>[10,11]</sup>。当机体发生急性失代偿性心力衰竭时能够减低其对BNP的敏感性,因此对神经激素无法起到拮抗作用。重组脑钠肽是一种具有活性的人工合成肽,是抗心衰的新型药物。硝普钠是临幊上治疗心力衰竭的常用药物,对心衰有一定的改善作用<sup>[12]</sup>。

近年来研究表明,心力衰竭和炎症反应联系紧密,TNF- $\alpha$ 、hs-CRP等炎症因子能够介导机体的炎症反应,从而对其他细胞因子造成影响,诱导心肌肥厚、心功能不全等<sup>[13,14]</sup>。IL-6可由

多种活性细胞合成并分泌,是炎症反应中的主要介质,其可与心肌细胞的特定受体结合后形成复合物,起到细胞毒性及负性肌力的作用<sup>[15]</sup>。有研究发现,重组脑钠肽能够使急性心肌损伤小鼠的炎症信号通路产生抑制,减轻缺血引起的再灌注损伤,提示重组脑钠肽能够起到抗炎作用<sup>[16]</sup>。本研究显示,重组脑钠肽治疗后TNF- $\alpha$ 、hs-CRP、IL-6、BNP水平低于硝普钠治疗者,进一步证实重组脑钠肽能够降低炎症因子水平,进而减轻炎症反应对机体造成的损伤,延缓病情。本研究发现,急性失代偿性心力衰竭患者发病后血管紧张素II可有上升,但用药后可恢复至发病前水平,经重组脑钠肽治疗后血管紧张素II更低,且醛固酮和血浆肾素活性的改善均比较显著,表明重组脑钠肽对机体的肾素系统有良好的抑制作用,从而纠正机体的内分泌系统紊乱,缓解心力衰竭症状,可能与其能够导致外周交感神经受到抑制作用,使其神经兴奋性减弱,减少促肾上腺素激素及血管加压素的合成有关<sup>[17]</sup>。

有研究指出,肾素系统的异常激活能够引起血流动力学变化,影响其稳定性,又进一步加剧内分泌系统紊乱,形成恶性循环<sup>[18]</sup>。本研究显示,重组脑钠肽治疗后患者血流动力学显著降低,可能与其能够好血管内皮细胞和平滑肌受体作用,增加鸟甘酸环化酶的分泌,促进小动脉的扩张,减轻心脏负荷;其次能够增加肾小球对钠的吸收率,使钠排泄增强,从而起到利尿作用,导致外周体循环阻力减弱有关<sup>[19]</sup>。有研究发现,重组脑钠肽

对急性失代偿性心力衰竭患者的心功能有改善作用。本研究显示经重组脑钠肽治疗后患者左室射血分数明显增高,但左心室收缩末期内径变化不明显,考虑与治疗前后对比时间较短,导致其变化不大<sup>[20]</sup>。且经重组脑钠肽治疗后的副反应较少,安全性高,有较好的应用前景。

综上所述,急性失代偿性心力衰竭患者应用重组脑钠肽治疗可降低患者炎症因子,改善肾素系统。
