ABSTRACT Objective: To explore the clinical effect of CPM combined with early rehabilitation training on the functional recovery of elbow joint in children with elbow fracture. **Methods:** 122 children with elbow fractures in our hospital from December 2015 to February 2017 were chosen as the research object. According to the differences of postoperative rehabilitation model, they were divided into the study group (CPM combined with early rehabilitation training) and the control group (given early rehabilitation training), and 61 cases in each group. The results of the elbow function score and the comprehensive curative effect were observed and compared between the two groups before and after treatment. **Results:** (1) After treatment, the elbow function score of the study group was significantly better than that of the control group, and the differences were with statistical significance. (2) After treatment, the excellent rates compared between the two groups, the study group was higher than the control group, and the differences were with statistical significance. **Conclusion:** CPM combined with early rehabilitation training can effectively promote the recovery of elbow joint function in children with elbow fracture, which is one of the ideal choices in clinical practice.

前言

与成人相比,儿童的肘部骨质结构较为脆弱,骨密度和强度均不如成人。因此,儿童肘部较成人来说更容易发生骨折显著^[1]。并且近年来儿童骨折发病率呈现出了一定的升高趋势^[2]。儿童一旦并发肘部骨折,不仅对其正常的生活、学习带来较大不方便,同时可在一定程度上影响儿童后续的生长发育,甚至能够带来一定的心理问题^[3]。目前临幊上针对儿童肘部骨折的治疗以手术、内固定及外固定为主^[4,5],患儿术后康复过程尤为重要。有效的康复措施和方法对于患儿肘部功能的恢复意义重大。鉴于此,本次研究以儿童肘部骨折术后康复为研究对象,选

取我院骨科收治的儿童肘部骨折患者 122 例,给予其不同康复措施和方法,对其肘关节功能恢复效果进行了如下比较研究和报道。

3 讨论

肘部骨折在儿童骨关节损伤中最常见。儿童处于生长期，儿童期骺软骨板的强度远不如韧带和关节囊，有研究证明骺板的强度比肌腱弱2~5倍，从高处跳下、摔倒、玩滑板、滑旱冰等均能造成肘部骨折。儿童肘部骨折患儿在给予手术治疗后，会不同程度的出现患儿关节功能障碍。不仅影响患儿的生活质量，同时在一定程度上会影响患儿的生长发育^[7]。对儿童肘部骨折不仅要求解剖复位而且要不遗留功能障碍。调查显示骨折患者在出院时对康复锻炼的指导时间、次数和方法、定期复查的时间和方法等知识的需求明显上升。肘关节的功能位是屈曲1%A其最有用的活动范围在60-120度之间前臂的功能位是旋前旋后中立位，其最有用的活动范围是旋前旋后各45度。在上肢损伤的功能锻炼中最容易出问题是肘关节伸屈和旋转功能的恢复程度，而这又直接关系到手的灵活性。因此，针对于肘部骨折患儿术后关节功能恢复的相关研究具有重要的社会意义和临床价值。

既往文献研究认为^[8-11]：针对于儿童肘部骨折患儿术后功能恢复以早期康复训练措施为主。随着医学理论和观点的不断发展，近年来持续被动活动观念在临床术后关节功能的恢复实践中得以广泛推行和认可^[12]。持续被动活动的主要原理就是通过给予肘关节功能障碍患儿肌肉一定的锻炼，从而确保其肌肉力量能够在一定时间内得到加强或者恢复^[13]。从目前的临床实践应用效果上分析，这种康复措施和方法较好的提高了患儿术后关节的恢复效果。

同时，进一步对相关临床实践进行总结后我们发现^[14-15]：CPM能够显著的促进患儿术后肘关节早期功能的恢复，但是被动运动最终仍然要被关节的主动活动所替代。因此，对于患儿术后的CPM来说，这仅仅是一个过渡阶段。在CPM计划实施结束后，相关患儿还要进行主动锻炼，这样才能彻底改善关节功能，最终确保恢复效果达到满意状态。

此外，除了CPM以外，其他众多临床辅助疗法也被证实能够有效的促进关节功能恢复。这些方法主要包括：微波、热敷及按摩等，这些辅助疗法的基本原理就是通过改善血液循环功能，从而促进微循环系统的通畅，进而实现有效缓解关节周围粘连，促使组织再生等目的，最终促进关节功能恢复^[16-20]。

从本文研究的比较结果上看：治疗后研究组61例患者中，优良患者共计50例，优良率为81.97%，治疗后对照组61例患者中，优良患者共计34例，优良率为55.74%。优良率组间比较，研究组高于对照组，且差异显著。这不仅说明CPM的临床比较优势，同时也证实了上述的观点和说法。

因此，综上所述，CPM结合早期康复训练能够有效的促进儿童肘部骨折术后肘关节功能恢复，是临床实际中的理想选择之一。
