ABSTRACT Objective: To investigate the levels of rheumatoid factor (RF), anti-nuclear antibody (ANA), anti-cyclic citrullinated peptide (CCP) antibodies, immune globulin (Ig), complement (C3, C4) and inflammatory factors in patients with rheumatoid arthritis (RA) and its clinical significance. **Methods:** A total of 165 patients with RA, who were treated in Affiliated Hospital of Traditional Chinese Medicine of Shanghai University of Traditional Chinese Medicine from September 2016 to April 2017, were chosen as group RA, among which, 93 patients were in the RA active phase (RA active group) and 72 patients were in remission stage of RA (RA remission group). 30 healthy volunteers were randomly chosen as control group in the same period. The serum RF, IgM, IgG, IgA, C3, C4 levels in each group were detected by immune scattering Turbidimetry. CCP antibodies in each group were detected by enzyme linked immunosorbent assay (ELISA). The interleukin-6 (IL-6) was detected by electrochemiluminescence assay, while the interleukin-8 (IL-8) was detected by Chemiluminescence. Immunofluorescence was used to detect ANA. The test indexes of different groups were compared. The correlation of RF, ANA, CCP antibodies, Ig, C3, C4 and inflammatory factors in RA patients was analyzed. **Results:** The serum RF, ANA, CCP antibodies, IgM, IgG, IgA, IL-6, IL-8 levels of RA active group and RA remission group were higher than those of control group, and the serum RF, ANA, CCP antibodies, IgM, IgG, IgA, IL-6, IL-8 levels of RA active group were higher than those of RA remission group, the differences were statistically significant ($P<0.05$). The serum C3, C4 levels of RA active group and RA remission group were lower than those of control group, and the serum C3, C4 levels of RA active group were lower than those of RA remission group, the differences were statistically significant ($P<0.05$). The Pearson product moment correlation analysis showed that serum RF, ANA, CCP antibodies, IgM, IgG, IgA in patients with RA active stage and RA remission stage were positively associated with IL-6, IL-8 ($P<0.05$), and the serum C3, C4 were negatively associated with IL-6, IL-8 ($P<0.05$). **Conclusion:** The RF, ANA, CCP antibodies, Ig and IL-6, IL-8 levels in patients with RA are significantly higher, and C3, C4 levels are significantly lower, especially in patients in RA active stage. Combined detection of RF, ANA, CCP antibodies, Ig, C3, C4 and IL-6, IL-8 can be used in the diagnosis and judgment of RA, which has an important reference significance in clinic.

前言

类风湿关节炎(rheumatoid arthritis, RA)是一种以对称性、多关节炎为主要特征的慢性系统性自身免疫性疾病,发病率0.5%~1.0%^[1,2]。RA并发症较多,可导致手、足以及其它关节发生炎症、僵直、破坏性改变等^[3,4]。RA早期缺乏特异性的临床表现,并且症状复杂多样,很多患者确诊时已错过最佳治疗时间,从而引发关节畸形等不良预后^[5,6]。早发现、早诊断、早治疗是提高患者临床治疗效果,改善预后的重要措施。类风湿性因子(rheumatoid factor, RF)、抗核抗体(anti-nuclear antibody, ANA)、抗环瓜氨酸肽抗体(anti-cyclic citrullinated peptide, CCP抗体)、免疫球蛋白(immune globulin, Ig)是临床诊断RA常见的实验室检查指标,研究发现^[7,8],分别检测RF、ANA、CCP抗体,Ig对诊断RA的灵敏度或特异性相对较低,可能出现漏诊和误诊。本研究对RA患者血清中RF、ANA、CCP抗体、Ig(IgM、IgG、IgA)、补体(C3、C4)以及炎症因子水平进行检测,旨在探讨联合检测对诊断RA的临床价值。现报道如下。

3 讨论

RA 是临床常见的以侵袭关节为主要特征的慢性、进展性自身免疫性疾病, 病理特征包括持续呈进行性的滑膜炎, 以及由其所致的软骨损伤、关节骨侵蚀等, 活动期的 RA 患者临床症状有关节压痛、肿胀、僵硬, 晚期患者因骨质遭到重大破坏和吸收, 而致关节畸形、僵直以及功能障碍, 致残率极高^[12-14]。早发现、早诊断、早治疗是改善患者病情, 促进预后的重要措施。实验室检查指标结合临床表现、X 线平片是诊断 RA 的重要措手段^[15,16]。RF 在 RA 患者体内呈明显高水平, 是临床诊断 RA 最

常见的实验室指标, 但是研究发现 RF 在恶性肿瘤、系统性红斑狼疮等疾病中水平也较高, 可见 RF 缺乏特异性, 极易造成误诊和漏诊, 从而延误对病情的治疗^[17,18]。

随着医学研究的快速发展, 一系列实验室指标逐渐用于临床辅助诊断 RA, ANA 是用于诊断风湿性疾病等自身免疫性疾病的重要指标, 它在不同疾病中的特征有一定差异, 研究显示^[19], ANA 用于诊断 RA 的灵敏度为 30.0%, 但是特异度却高达 95.0%, 可见, ANA 辅助诊断 RA 有一定价值。CCP 抗体作为一种有病理生理意义的自身抗体, 是 RA 的敏感、特异性指标, 它对 RA 的灵敏度为 65%~80%, 特异度为 90%~99%, 在 2010 年已被纳入 ACR-EULAR RA 的分类诊断标准^[20,21]。Ig 主要包括 IgM、IgG、IgA 等抗体, 参与了体液免疫环节, 而体液免疫发生紊乱正好与 RA 发病密切相关, 文献报道^[22,23], 血清 Ig 在 RA 患者血清中明显升高, 并且是评估 RA 病情进展的重要指标。补体 C3、C4 是有重要生物学功能的血清补体成分, 在反复感染、类风湿性关节炎、自身免疫性溶血性贫血等疾病中明显降低,

RA	Indexes	IL-6		IL-8

	IgA	0.467	0.002	0.468	<0.001
	C3	-0.514	0.001	0.472	-0.001
	C4	-0.473	0.003	-0.385	0.001

其中 C4 水平降低在系统性红斑狼疮更为显著^[24]。IL-6、IL-8 是由内皮细胞、活化的单核巨噬细胞等细胞在病毒感染等外来刺激作用下分泌的炎症因子,具有广泛的生物活性,介导了机体的炎症反应和病理生理过程,RA 患者血管内皮细胞出现损伤会引起机体炎症因子的异常,提示 IL-6、IL-8 可能参与了 RA 的发病过程^[25,26]。

本研究通过检测 RA 患者血清 RF、ANA、CCP 抗体、Ig、C3、C4 以及 IL-6、IL-8 水平,旨在探讨联合检测对 RA 的诊断价值。结果显示,RA 活动组、RA 缓解组血清 RF、ANA、CCP 抗体、IgM、IgG、IgA 水平高于对照组,并且 RA 活动组血清 RF、ANA、CCP 抗体、IgM、IgG、IgA 水平高于 RA 缓解组,说明 RF、ANA、CCP 抗体、IgM、IgG、IgA 参与了 RA 的发病过程,并且与 RA 的病情进展密切相关。有研究认为^[27,28],C3、C4 诊断 RA 无明显意义,仅能作为了解 RA 病情的客观指标。本研究结果显示,RA 活动组、RA 缓解组血清 C3、C4 水平低于对照组,并且 RA 活动组血清 C3、C4 水平低于 RA 缓解组,与上述研究结果不一致,因此,C3、C4 能否用于辅助诊断 RA 还需要进一步、大样本的研究。结果还显示,RA 活动组、RA 缓解组患者血清 IL-6、IL-8 水平低于对照组,并且 RA 活动组患者血清 IL-6、IL-8 水平低于 RA 缓解组,提示炎症因子 IL-6、IL-8 共同参与了 RA 的病理过程,Terenzi 等人^[29,30]的研究结果显示,IL-6、IL-8 在 RA 发病过程中有重要作用,本研究结果与其一致。经 Pearson 积矩相关分析,活动期、缓解期 RA 患者血清 RF、ANA、CCP 抗体、IgM、IgG、IgA 与炎症因子 IL-6、IL-8 呈相关性,而 C3、C4 与炎症因子 IL-6、IL-8 呈负相关性,提示上

述指标联合检测对早期辅助诊断 RA 及评估患者病情具有重要意义。

综上所述,RA 患者血清 RF、ANA、CCP 抗体、IgM、IgG、IgA、C3、C4 以及 IL-6、IL-8 存在不同程度的异常和改变,联合检测可在早期辅助诊断及评估 RA 患者病情,在临幊上有重要的参考价值。
